Contributed session: Developing, administering and refining
measurement instruments in Social Sciences

19 Settembre 2024

1 Aim

2 Item Response Theory and Information Functions

- 2-Parameter Logistic Model
- Item and Test Information Functions

3 Item Selection Procedures

- Item Locating Algorithm – ILA
- Brute Force Procedure

4 Simulation Study

- Simulation design
- Comparison
- Results

New Item Response Theory-based algorithm for the development of
informative short test forms

1 Aim

2 Item Response Theory and Information Functions

- 2-Parameter Logistic Model
- Item and Test Information Functions

3 Item Selection Procedures

- Item Locating Algorithm – ILA
- Brute Force Procedure

4 Simulation Study

- Simulation design
- Comparison
- Results

$$P(x_{pi} = 1 | \theta_p, b_i, a_i) = \frac{\exp[a_i(\theta_p - b_i)]}{1 + \exp[a_i(\theta_p - b_i)]}$$

1 Aim

2 Item Response Theory and Information Functions

- 2-Parameter Logistic Model
- Item and Test Information Functions

3 Item Selection Procedures

- Item Locating Algorithm – ILA
- Brute Force Procedure

4 Simulation Study

- Simulation design
- Comparison
- Results

Item Information Function (IIF):

$$I_i(\theta) = a_i^2 P_i(\theta, b_i, a_i)[1 - P_i(\theta, b_i, a_i)]$$

Test Information Function (TIF):

$$I(\theta) = \sum_{i=1}^I I_i(\theta)$$

Q : vector of the item indexes selected for inclusion in the STF up to that iteration

TIF^* : TIF target

$TIF_{TE} = \frac{\sum_{i \in Q} IIF_i}{||Q||}$, where $||Q||$ denotes the cardinality of Q

Termination criterion:

The algorithm iterates the following steps until the termination criterion is reached:

① $\Delta_{TIF} = |TIF^* - TIF_{TE}|.$

② $\theta_{target} = \arg \max \Delta_{TIF}$

③ $\operatorname{argmin}_{i \in \{1, \dots, N\} \setminus Q} |\theta_{target} - b_i|$

④ $TIF_{TE} = \frac{\sum_{i \in Q} IIF_i}{||Q||}$

⑤ Repeat from Step 1 until the termination criterion is reached

N : Number of items in the item bank

$L = N - 1$: Maximum length of the STFs that can developed from the item bank

$\binom{N}{l}$: number of STFs resulting from the combination of the $l = \{1, \dots, L\}$ items

The algorithm iterates the following steps until the termination criterion is reached:

- ① \overline{TIF} for each STF of length l
- ② $\Delta_{TIF} = TIF^* - \overline{TIF}$
- ③ $\overline{\Delta}_{TIF}$

The best STF is the one with the lowest value of $\overline{\Delta}_{TIF}$, that is the one that presents the lowest absolute distance from the TIF target.

100 iterations:

- ① Generate an item bank of $N = 6$ items:
 - Difficulty parameters: $\mathcal{U}(-3, 3)$
 - Discrimination parameters: $\mathcal{U}(.90, 2.0)$
- ② Generate TIF^* by randomly selecting items from the item bank (Mean number of items = 3.34 ± 1.13). The parameters of the selected items are modified according to values drawn from uniform distributions $\mathcal{U}(-0.20, 0.20)$.
- ③ Considering the TIF^* at Step 2 and the item parameters at Step 1:
 - ILA \rightarrow Forwardly searches for the best item selection to recover the TIF^*
 - BFP \rightarrow tries every possible item combination to find the STF best able to recover TIF^* $N = 6$ items, $L = 5$ and $\binom{6}{1} + \binom{6}{2} + \binom{6}{3} + \binom{6}{4} + \binom{6}{5} = 62$ STFs are developed and compared.
